Rainbow colour scales are popular.
They're pretty.

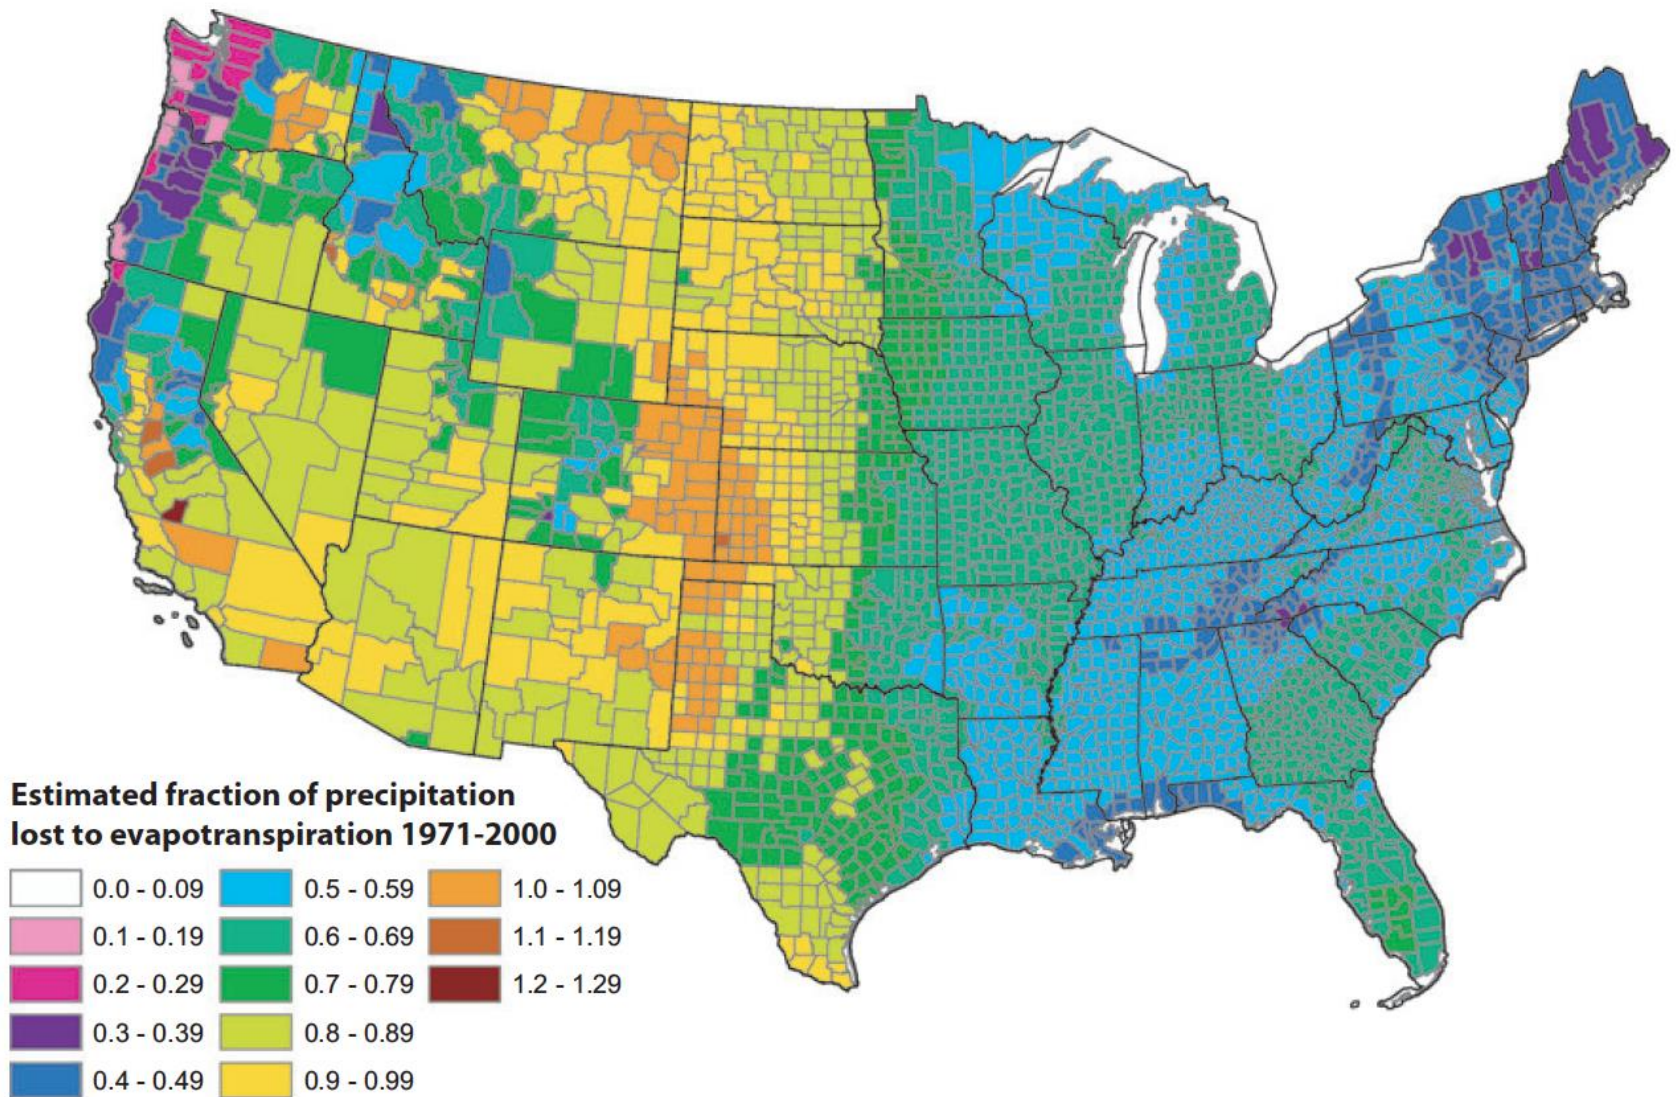

FIGURE 13. Estimated Mean Annual Ratio of Actual Evapotranspiration (ET) to Precipitation (P) for the Conterminous U.S. for the Period 1971-2000. Estimates are based on the regression equation in Table 1 that includes land cover. Calculations of ET/P were made first at the 800-m resolution of the PRISM climate data. The mean values for the counties (shown) were then calculated by averaging the 800-m values within each county. Areas with fractions >1 are agricultural counties that either import surface water or mine deep groundwater.

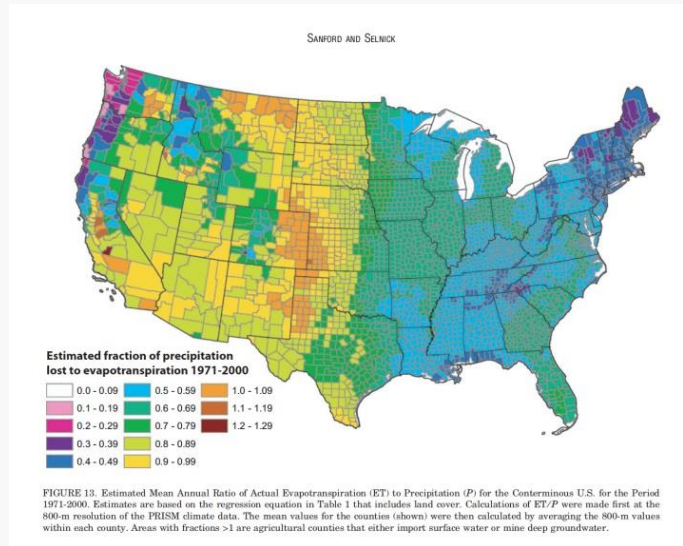

Can you put these circles in order?

Let's look at the colour scale from the map again.

By looking at just luminance values, we can see the problem.

This is the luminance plot for ‘jet’.

Here are some examples of rainbow vs
grayscale

The 'jet' colormap must die! Or: how to improve plots and create your own nice colormap

Let's talk colormaps.

Rainbow Color Map (Still) Considered Harmful

David Borland
and Russell M.
Taylor II
*University of
North Carolina
at Chapel Hill*

Research has shown that the rainbow color map is rarely the optimal choice when displaying data with a pseudocolor map. The rainbow color map confuses viewers through its lack of perceptual ordering, obscures data through its uncontrolled luminance variation, and actively misleads interpretation through the introduction of non-data-dependent gradients.

Despite much published research on its deficiencies, the rainbow color map is prevalent in the visualization

mercials, weather forecasts, and even the IEEE Visualization Conference 2006 call for papers, just to name a few. The problem with this wide use of the rainbow color map is that research shows that it is rarely, if ever, the optimal color map for a given visualization.¹⁻⁶ Here we will discuss the rainbow color map's characteristics of confusing the viewer, obscuring data, and actively misleading interpretation.

course!"

Choosing the right colour scale depends on the type of data you are plotting.

Some well-behaved palettes:

An example.
Which model performs better?

RMS error for model 2 - RMS error for model 1

How about now?

RMS error for model 3 - RMS error for model 1

Same data. Different colour scale.
Same answer?

RMS error for model 2 - RMS error for model 1

RMS error for model 3 - RMS error for model 1

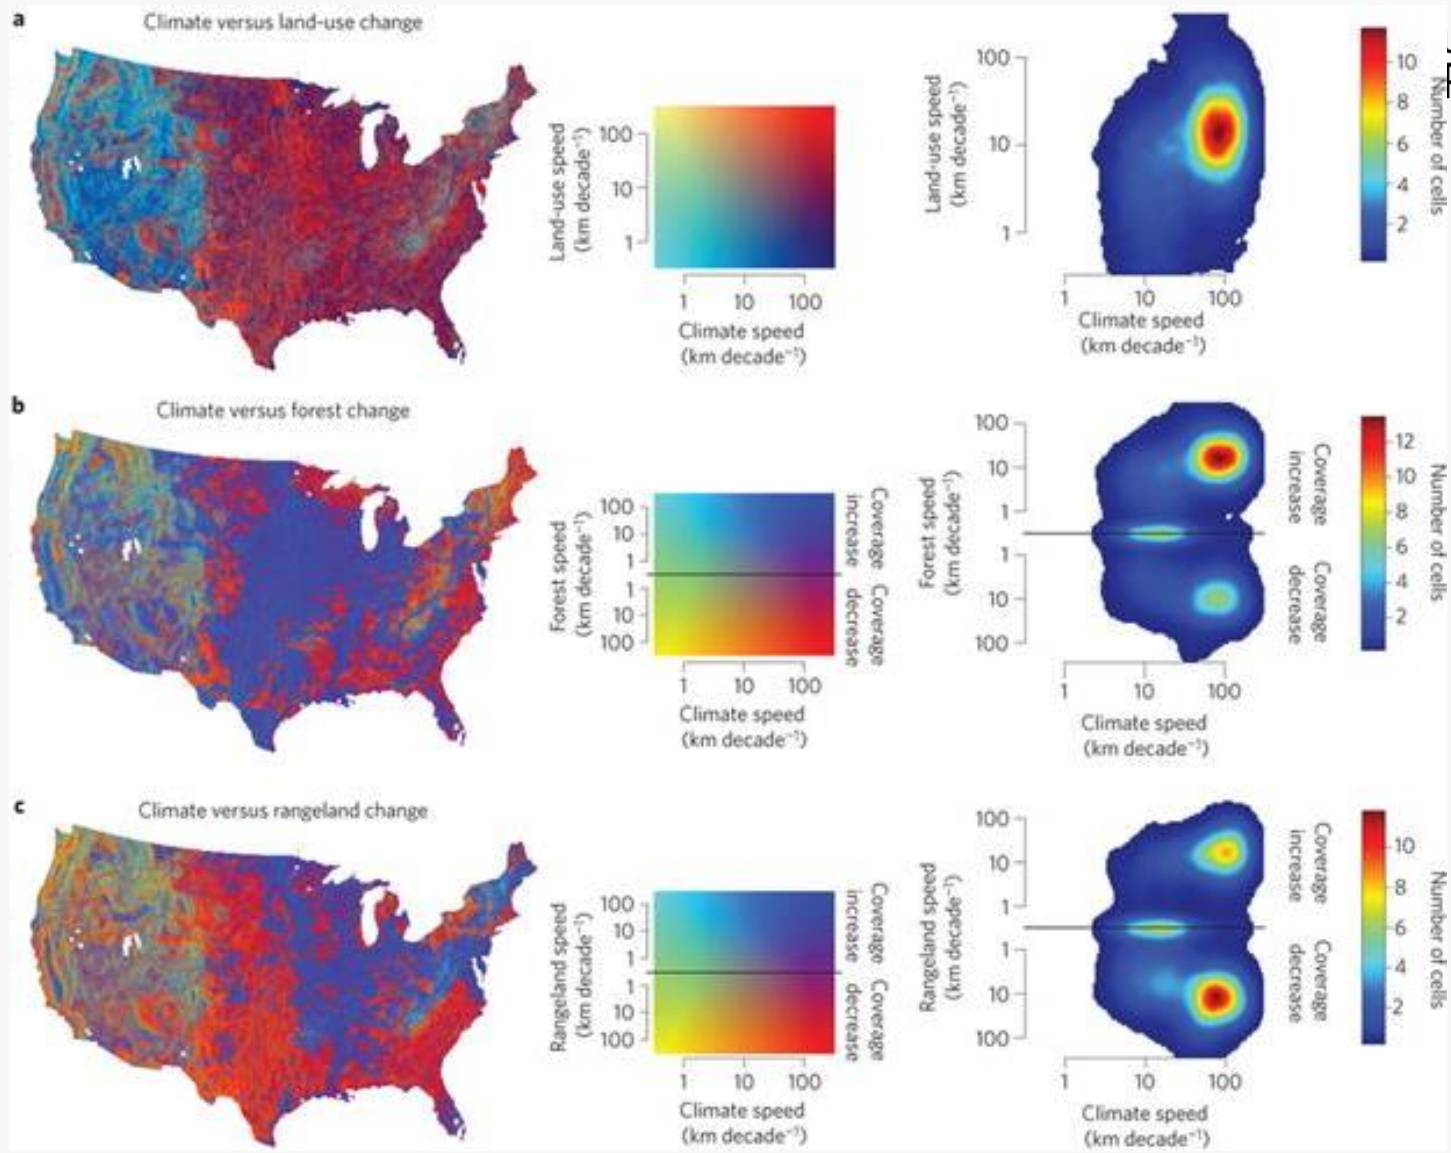

Another example: Let me introduce you to my friend Nick.

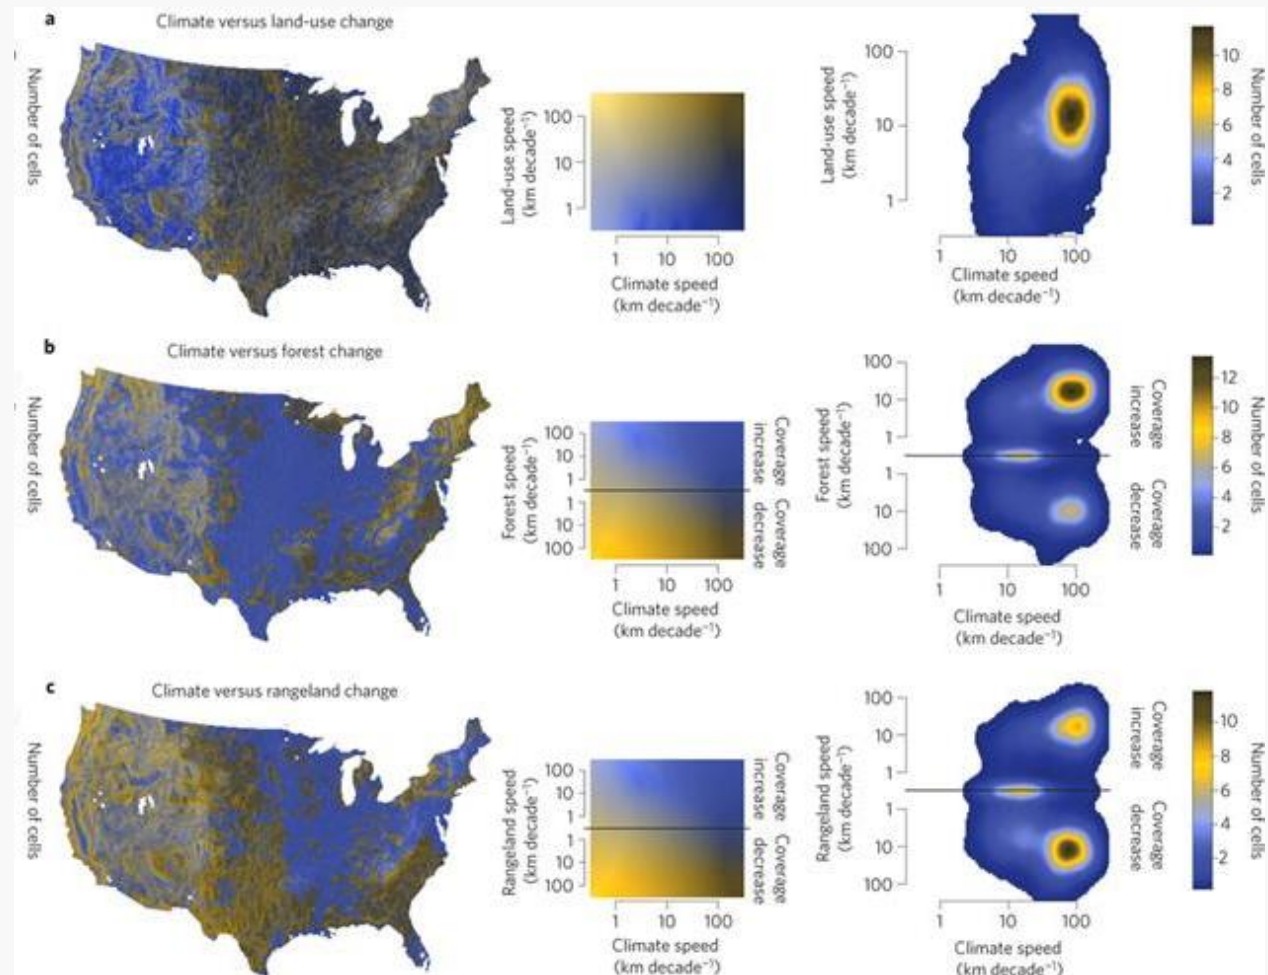

Let's assume I'm showing him this recent article in nature.

He sees the
plot like this.

Do you need colour at all?

To recap. Some guidance...

- Don't just use default settings – choose your colour scale with care.
 - Be especially of rainbow/multi-hue colour scales!
- Check whether changing your colour scale changes your interpretation of the data.
- Be aware of colourblindness.
- Consider using greyscale!

There are resources to help you!
